# DATA STRUCTURES AND ALGORITHMS 1, CMP201

## TESTING PLATFORMS

- ▶ University computer in audio lab (White Space)
  - ▶ Windows 7 Professional Edition Service Pack 1 (Build 7601)
  - ▶ Intel(R) Core(TM) i5-3470 CPU @ 3.20GHz
  - ▶ 4 GB RAM
- ▶ My personal MacBook Pro
  - ▶ Windows 10 Education (BootCamp)
  - ▶ Intel(R) Core(TM) i7-4980HQ CPU @ 2.80GHz
  - ▶ 16.0 GB RAM
- ▶ All tests done using x86 solution platform

## RADIX SORT AND QUICKSORT CHARACTERISTIC

### ▶ Radix sort

- ▶ Best-case performance -  $O(n \log n)$
- ▶ Worst-case performance  $O(nw)$  :
  - ▶  $n$  - number of keys
  - ▶  $w$  average key length (unsigned long int - 4 bits)

### ▶ Quicksort

- ▶ Best-case performance -  $O(n \log n)$
- ▶ Worst-case performance -  $O(n^2)$

## SORTING ALGORITHMS

- ▶ My radix sort
  - ▶ Iterative version using queues as buckets
  - ▶ LSN - Least Significant Number
- ▶ My quicksort
  - ▶ Two partition
  - ▶ Pivot in the middle of an array - prevents worst-case behaviour -  $O(n^2)$  - on already sorted arrays

## APPLICATION STRUCTURE

- ▶ Populating vector with  $N \in [0, 10e8]$
- ▶ Sorting
  - ▶ radix sort
  - ▶ quicksort
  - ▶ `std::sort`
- ▶ Displaying results of each sort

# TIME COMPLEXITY OF DATA STRUCTURES USED FOR QUICKSORT AND RADIX SORT

- ▶ `std::queue` - FIFO - first in, first out - don't need to insert or randomly access elements
  - ▶ `push()` -  $O(1)$
  - ▶ `pop()` -  $O(1)$
  - ▶ `front()` -  $O(1)$
- ▶ `std::vector` - random access always  $O(1)$  - don't need to insert
  - ▶ `push_back()` -  $O(1)$
  - ▶ `at()` -  $O(1)$
  - ▶ `empty()` -  $O(1)$
  - ▶ `clear()` -  $O(1)$
  - ▶ `size()` -  $O(1)$
  - ▶ Make a vector with  $N$  elements (doesn't affect sorting) -  $O(n)$

## RESULTS TO PRESENT

- ▶ Using operator[] and at() function to randomly access a vector makes a slight difference when quicksorting
- ▶ In debug mode - up to 100x slower
- ▶ In debug mode - inefficient for  $N > 10^6$  for both methods
- ▶ Getting rid of warnings - almost 2x faster
- ▶ Listening to music through a browser - 1% slower
- ▶ For  $N > 10^8$  needs to be built using x64 solution platform and requires at least 4GB RAM)
- ▶ Constant sorting time ( $T = 0$ ) for all algorithms when  $N \leq 10^3$
- ▶ Constant sorting time ( $T = 0$ ) for quicksort and `std::sort` when  $N \leq 10^4$

## RESULTS – DIFFERENT RANDOM ACCESS METHODS

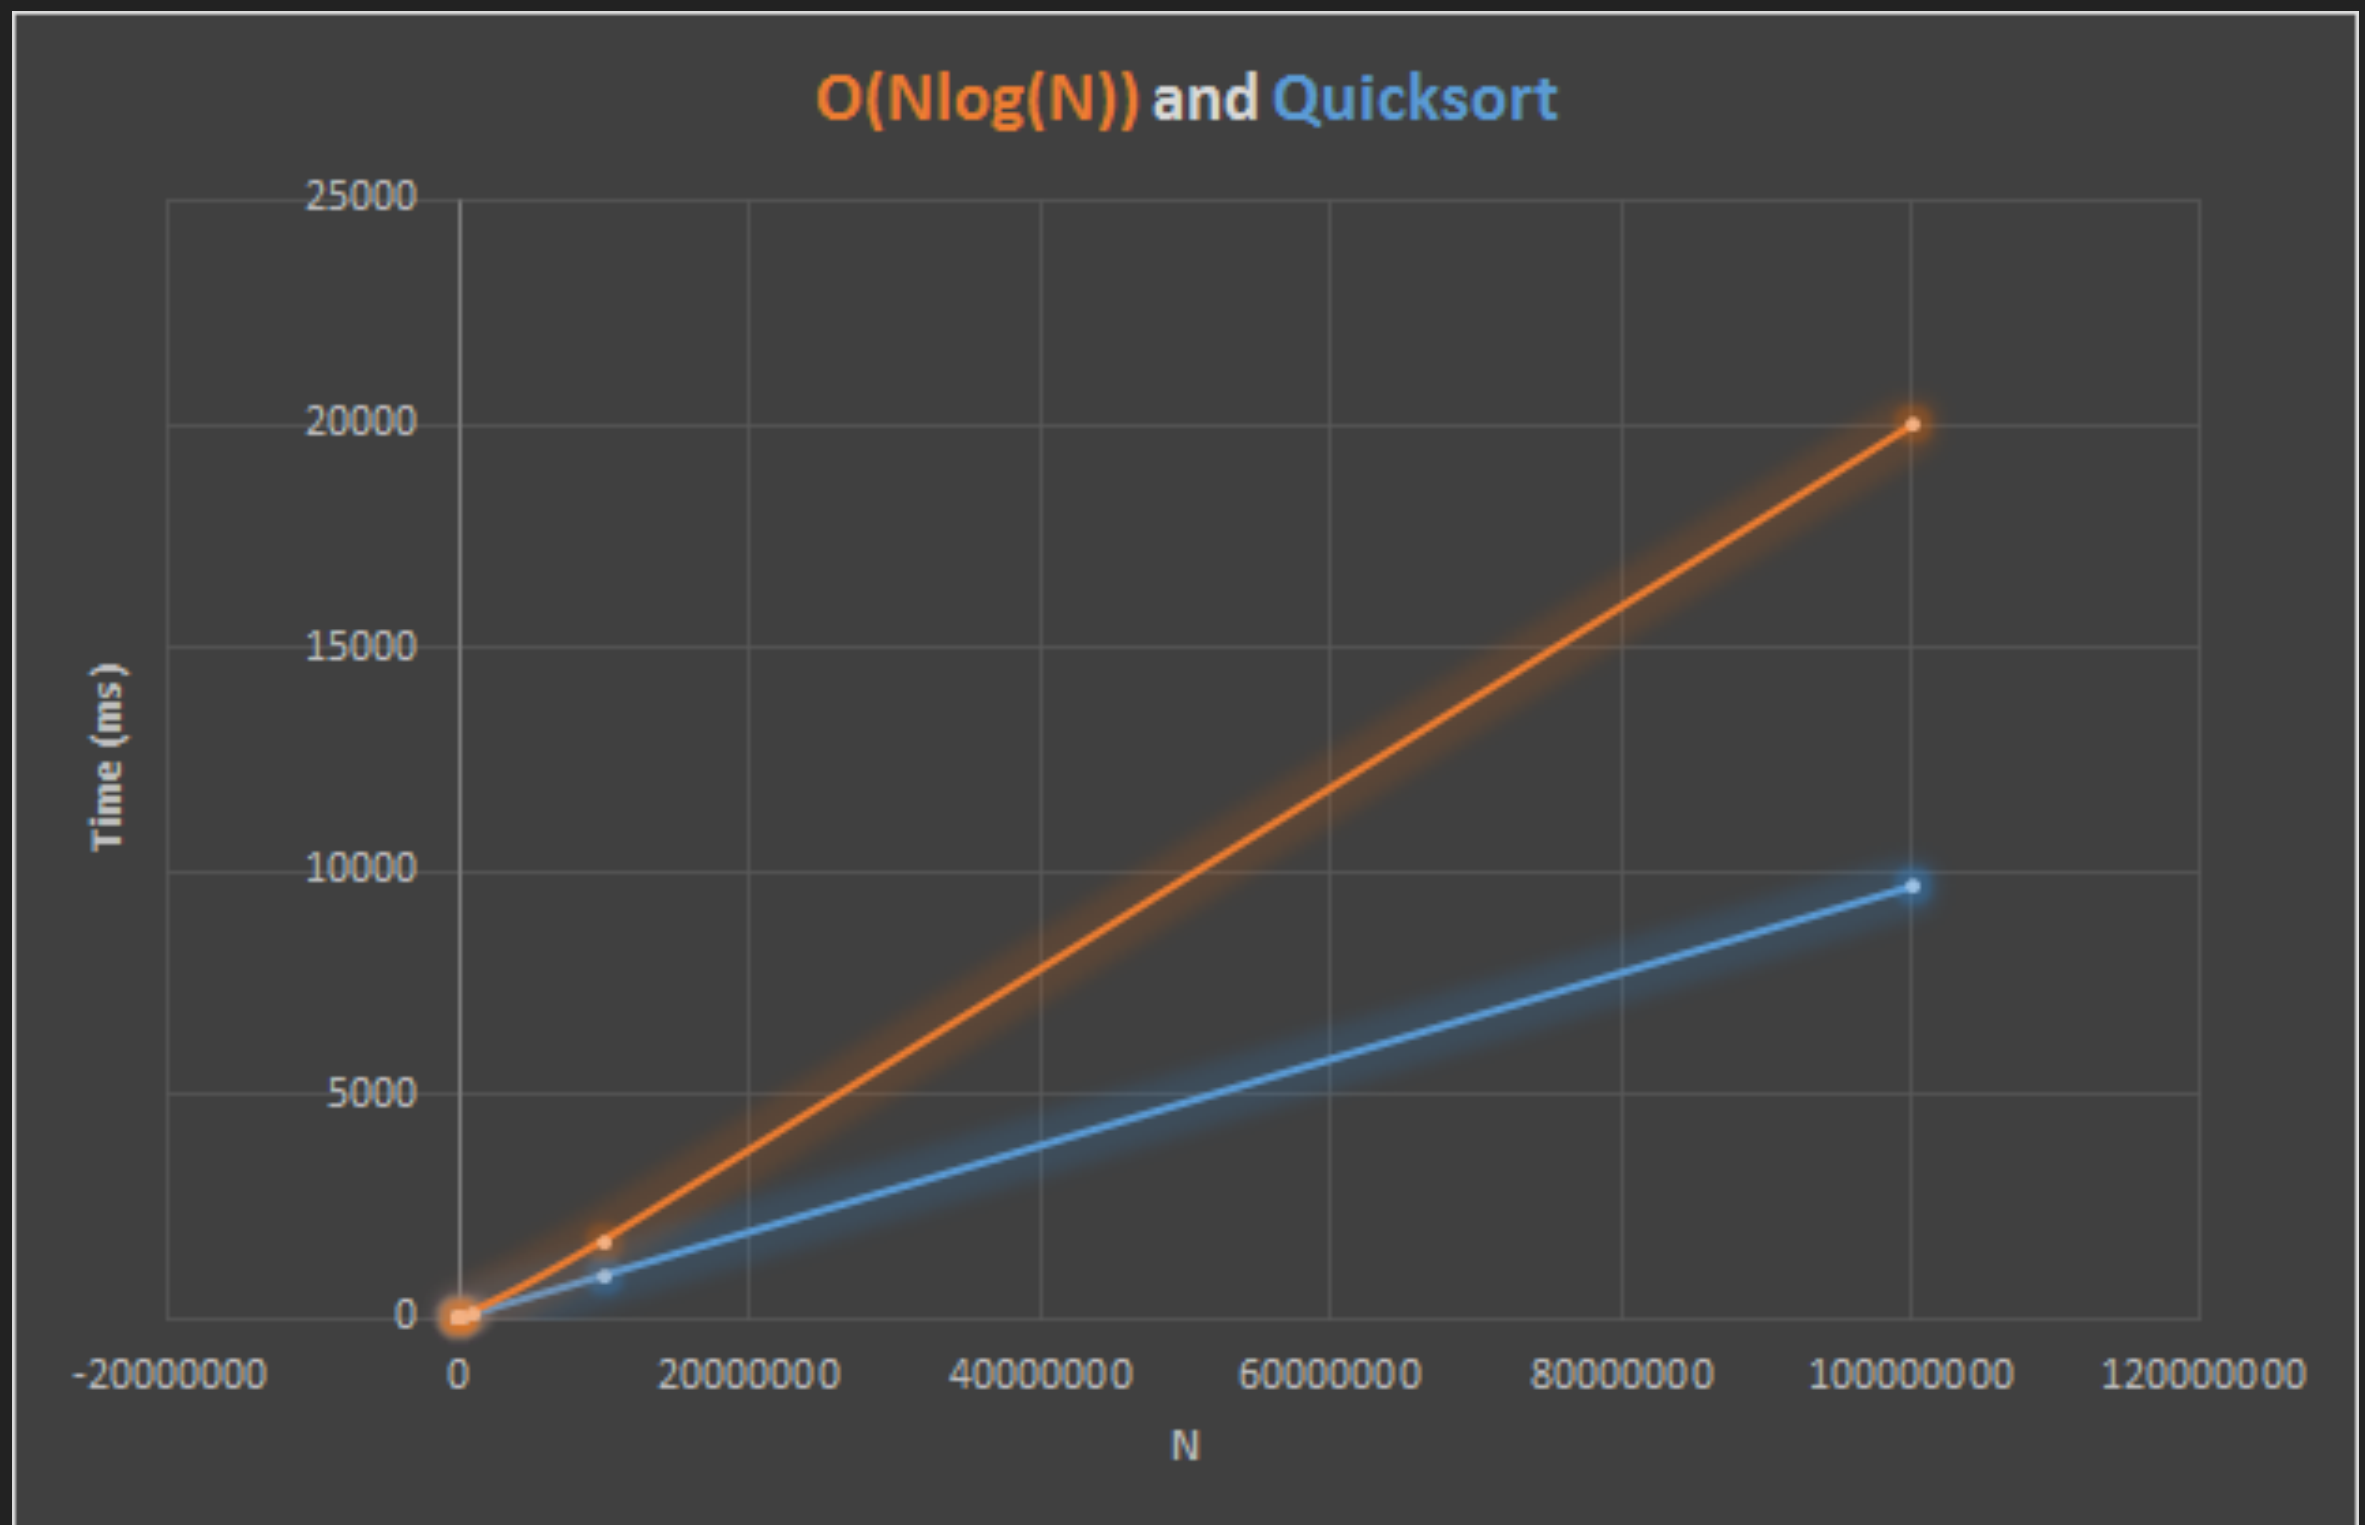

- ▶ Using operator[] and at() function to randomly access a vector makes a slight difference in quicksort

# QUICKSORT – RELEASE MODE – USING [] OPERATOR, NO WARNINGS

# QUICKSORT – RELEASE MODE – USING AT() FUNCTION, NO WARNINGS

## RESULTS – DIFFERENT RANDOM ACCESS METHODS

- ▶ Using operator[] and at() function to randomly access a vector makes no difference in radix sort

# RADIX SORT- RELEASE MODE - USING [] OPERATOR, NO WARNINGS

# RADIX SORT- RELEASE MODE - USING AT() FUNCTION, NO WARNINGS

## RESULTS – WARNINGS

- ▶ Getting rid of warnings - 1.77x faster quick sorting

# QUICKSORT – RELEASE MODE – USING AT() OPERATOR, WARNINGS

# QUICKSORT – RELEASE MODE – USING AT() FUNCTION, NO WARNINGS

## RESULTS – WARNINGS

- ▶ Getting rid of warnings - almost 1.27x faster radix sorting

# RADIX SORT- RELEASE MODE - USING AT() OPERATOR, WARNINGS

# RADIX SORT- RELEASE MODE - USING AT() FUNCTION, NO WARNINGS

## SORTING IN DEBUG MODE

- ▶ Up to 100x slower
- ▶ Inefficient for  $N > 10^6$  for both methods

## SORTING IN DEBUG MODE

- ▶ Quicksort
- ▶ Release mode
- ▶ Using at() operator
- ▶ No warnings
- ▶  $N \in [0, 10E6]$

## QUICKSORT – RELEASE MODE – USING AT() FUNCTION, NO WARNINGS, $N \in [0, 10E6]$

## QUICKSORT- DEBUG MODE - USING AT() FUNCTION, NO WARNINGS, $N \in [0, 10E6]$

## SORTING IN DEBUG MODE

- ▶ Quicksort-
- ▶ Release mode
- ▶ Using at() operator
- ▶ Warnings
- ▶  $N \in [0, 10e6]$

## QUICK SORT- RELEASE MODE - USING AT() FUNCTION, WARNINGS, $N \in [0, 10E6]$

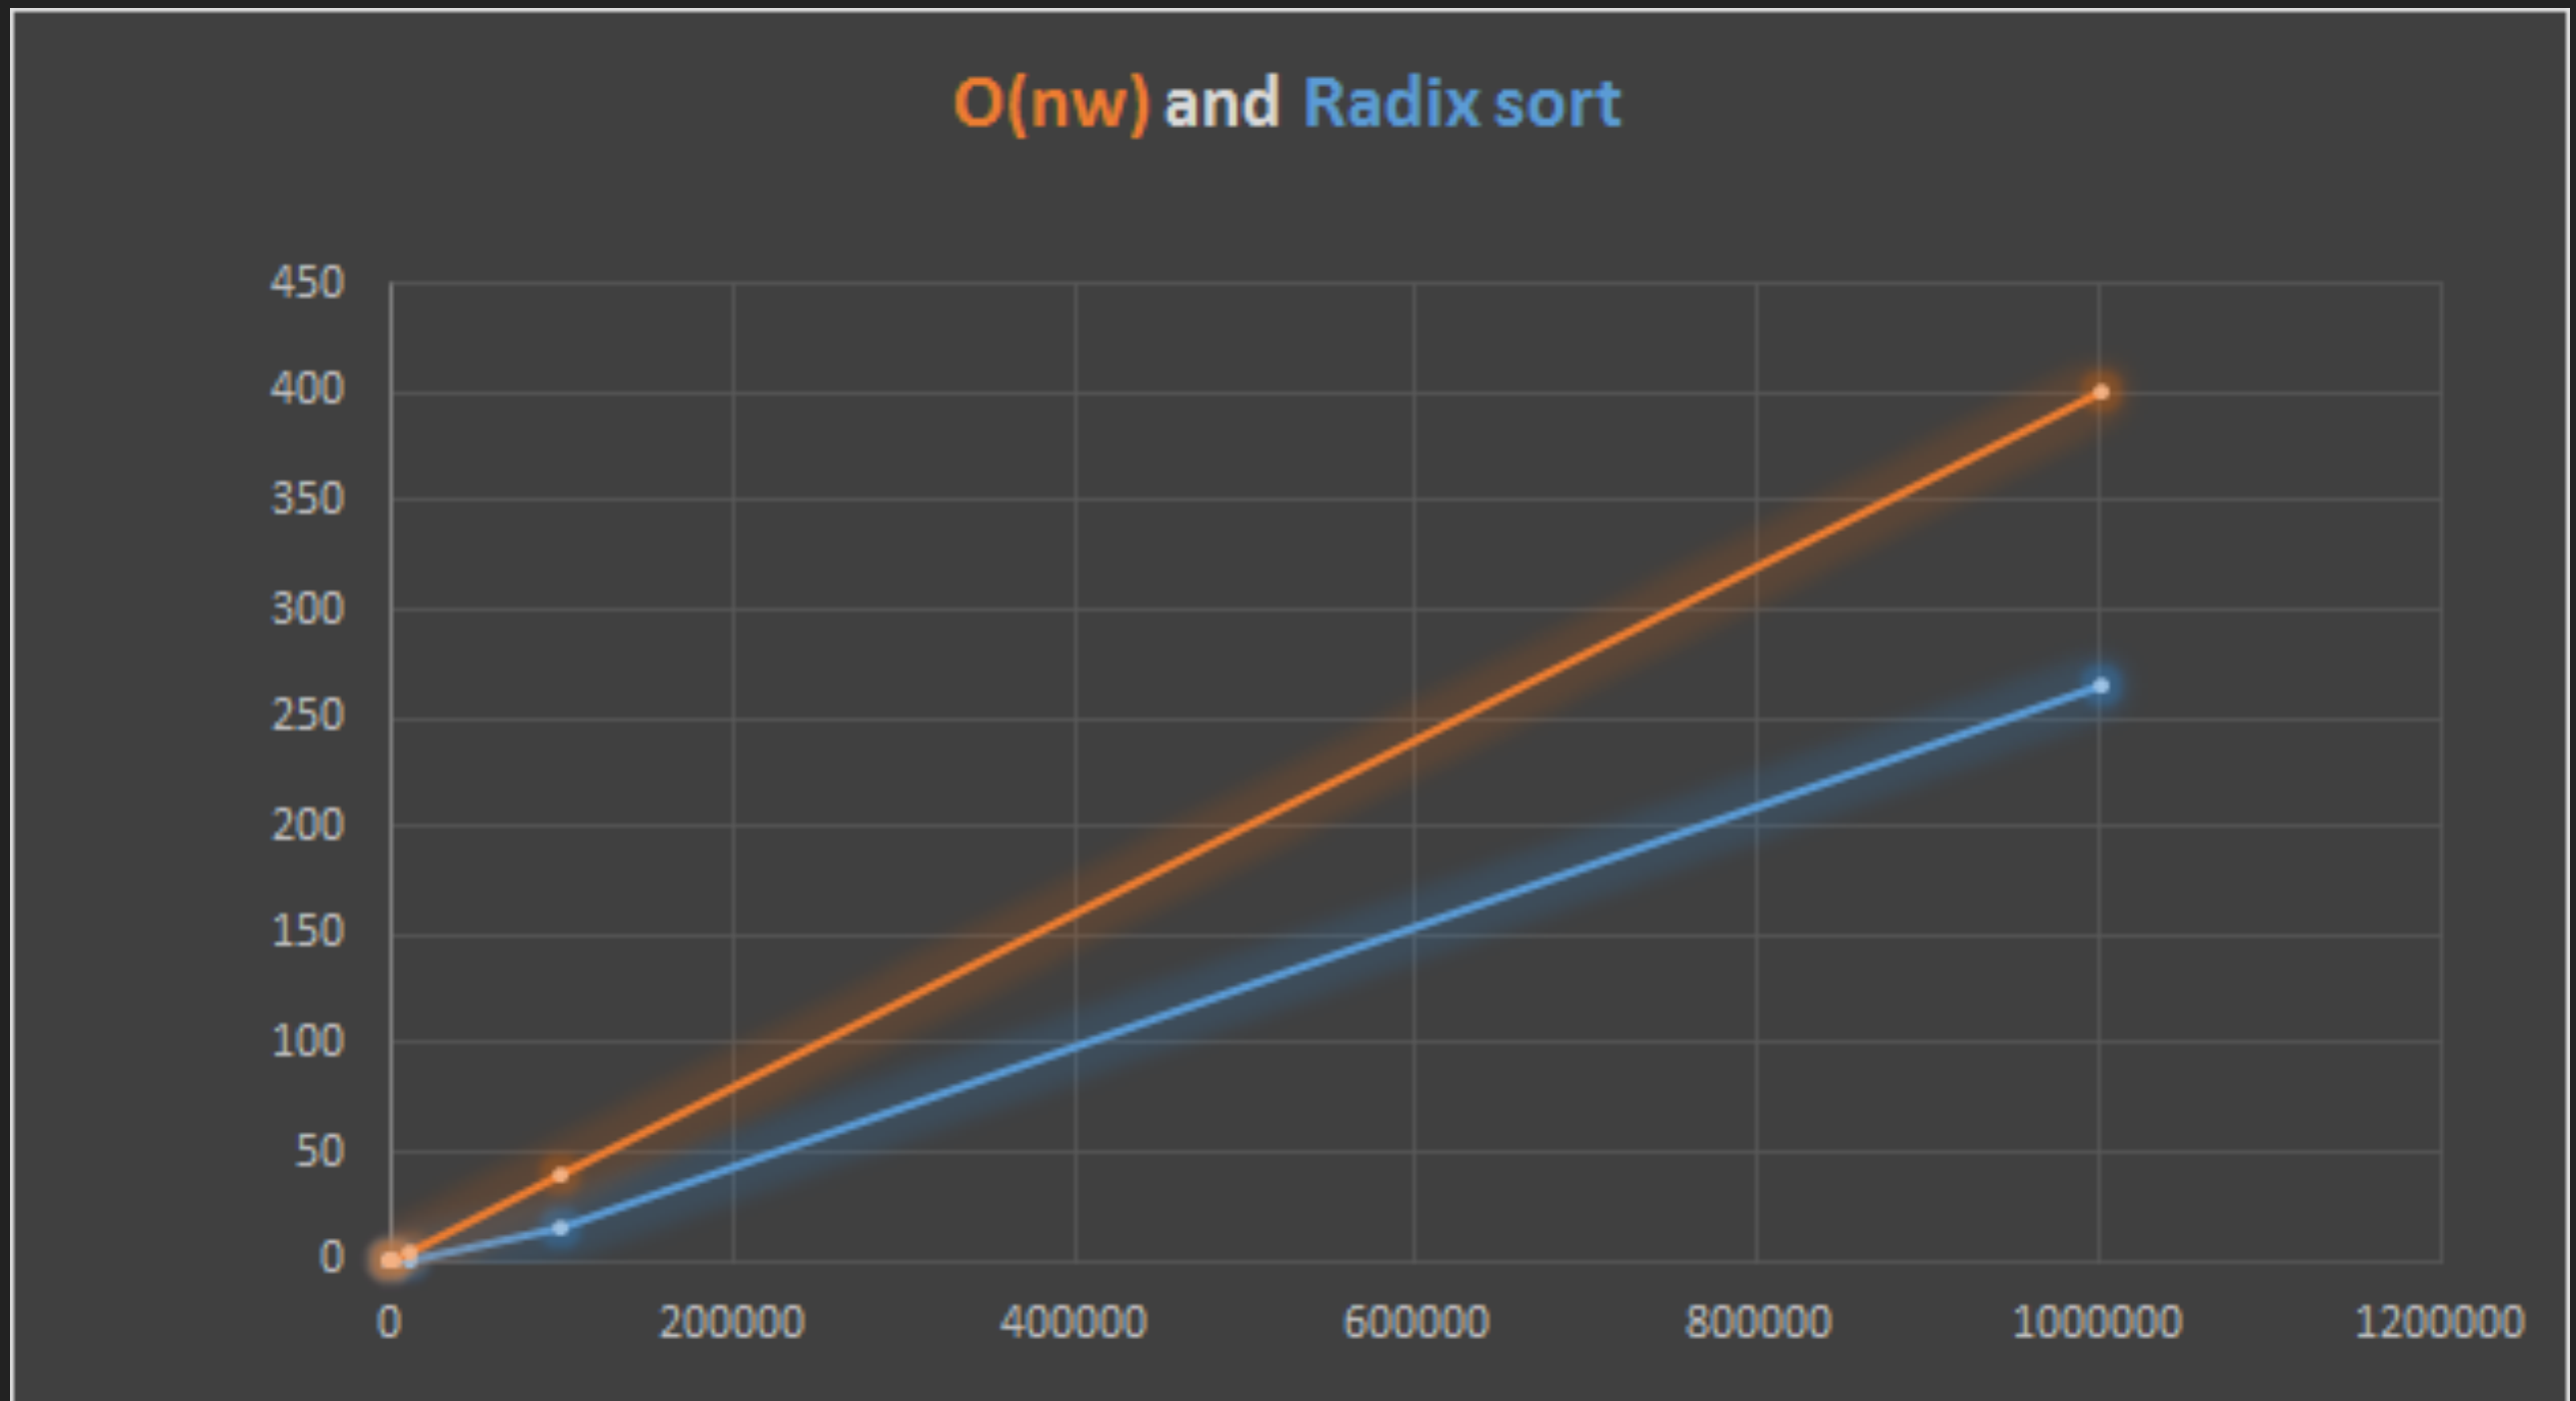

## QUICK SORT- DEBUG MODE – USING AT() FUNCTION, WARNINGS, $N \in [0, 10E6]$

## SORTING IN DEBUG MODE

- ▶ Radix sort
- ▶ Release mode
- ▶ Using at() operator
- ▶ No warnings
- ▶  $N \in [0, 10^6]$

## RADIX SORT- RELEASE MODE - USING AT() FUNCTION, NO WARNINGS, $N \in [0, 10E6]$

## RADIX SORT- DEBUG MODE - USING AT() FUNCTION, NO WARNINGS, $N \in [0, 10E6]$

## SORTING IN DEBUG MODE

- ▶ Radix sort
- ▶ Release mode
- ▶ Using at() operator
- ▶ Warnings
- ▶  $N \in [0, 10^6]$

## RADIX SORT- RELEASE MODE - USING AT() FUNCTION, WARNINGS, $N \in [0, 10E6]$

## RADIX SORT- DEBUG MODE – USING AT() FUNCTION, WARNINGS, $N \in [0, 10E6]$

## RESULTS – MY BEST RESULTS VS. STD::SORT

- ▶ quicksort - release mode - using [] operator, no warnings
- ▶ std::sort - release mode - no warnings

# QUICKSORT – RELEASE MODE – USING [] OPERATOR, NO WARNINGS

# STD::SORT – RELEASE MODE – NO WARNINGS

## PROFILING – MACBOOK PRO

- ▶ Turned off all output for CPU sampling
- ▶ Inclusive samples for:
  - ▶ radix sort: 42.04%
  - ▶ quicksort: 19.61%
  - ▶ std::sort: 16.15%
  - ▶ populating vector with random numbers: 2.13%

## RESULTS – UNI PC VS. MACBOOK PRO

- ▶ quicksort - release mode - using at() function, no warnings
- ▶ radix sort - release mode - using at() function, no warnings
- ▶ std::sort - release mode - no warnings

## RESULTS – UNI PC VS. MACBOOK PRO

- ▶ quicksort - release mode - using at() function, no warnings

## QUICKSORT – RELEASE MODE – USING AT() FUNCTION, NO WARNINGS, UNI PC

## QUICKSORT – RELEASE MODE – USING AT() FUNCTION, NO WARNINGS, MACBOOK PRO

## RESULTS – UNI PC VS. MACBOOK PRO

- ▶ radix sort - release mode - using at() function, no warnings

## RADIX SORT- RELEASE MODE – USING AT() FUNCTION, NO WARNINGS, UNI PC

## RADIX SORT- RELEASE MODE – USING AT() FUNCTION, NO WARNINGS, MACBOOK PRO

$O(nw)$  and Radix sort

## RESULTS – UNI PC VS. MACBOOK PRO

- ▶ `std::sort` - release mode - no warnings

# STD::SORT – RELEASE MODE – NO WARNINGS, UNI PC

## STD::SORT – RELEASE MODE – NO WARNINGS, MACBOOK PRO

## RESULTS – NOT-SORTED ARRAY VS. SORTED ARRAY (MACBOOK PRO)

- ▶ quicksort and sort perform better
  - ▶ quicksort - choosing pivot in the middle - prevents worst-case behaviour -  $O(n^2)$  - on already sorted arrays
- ▶ radix sort slightly worse

## RESULTS – NOT-SORTED ARRAY VS. SORTED ARRAY

- ▶ quicksort - release mode - using at() function, no warnings

QUICKSORT – NOT-SORTED – RELEASE MODE – USING AT() FUNCTION, NO WARNINGS, MACBOOK PRO

## QUICKSORT – SORTED – RELEASE MODE – USING AT() FUNCTION, NO WARNINGS, MACBOOK PRO

## RESULTS – NOT-SORTED ARRAY VS. SORTED ARRAY

- ▶ radix sort - release mode - using at() function, no warnings

RADIX SORT- NOT-SORTED – RELEASE MODE – USING AT() FUNCTION, NO WARNINGS, MACBOOK PRO

## RADIX SORT- SORTED – RELEASE MODE – USING AT() FUNCTION, NO WARNINGS

## RESULTS – NOT-SORTED ARRAY VS. SORTED ARRAY

- ▶ `std::sort` - release mode - no warnings

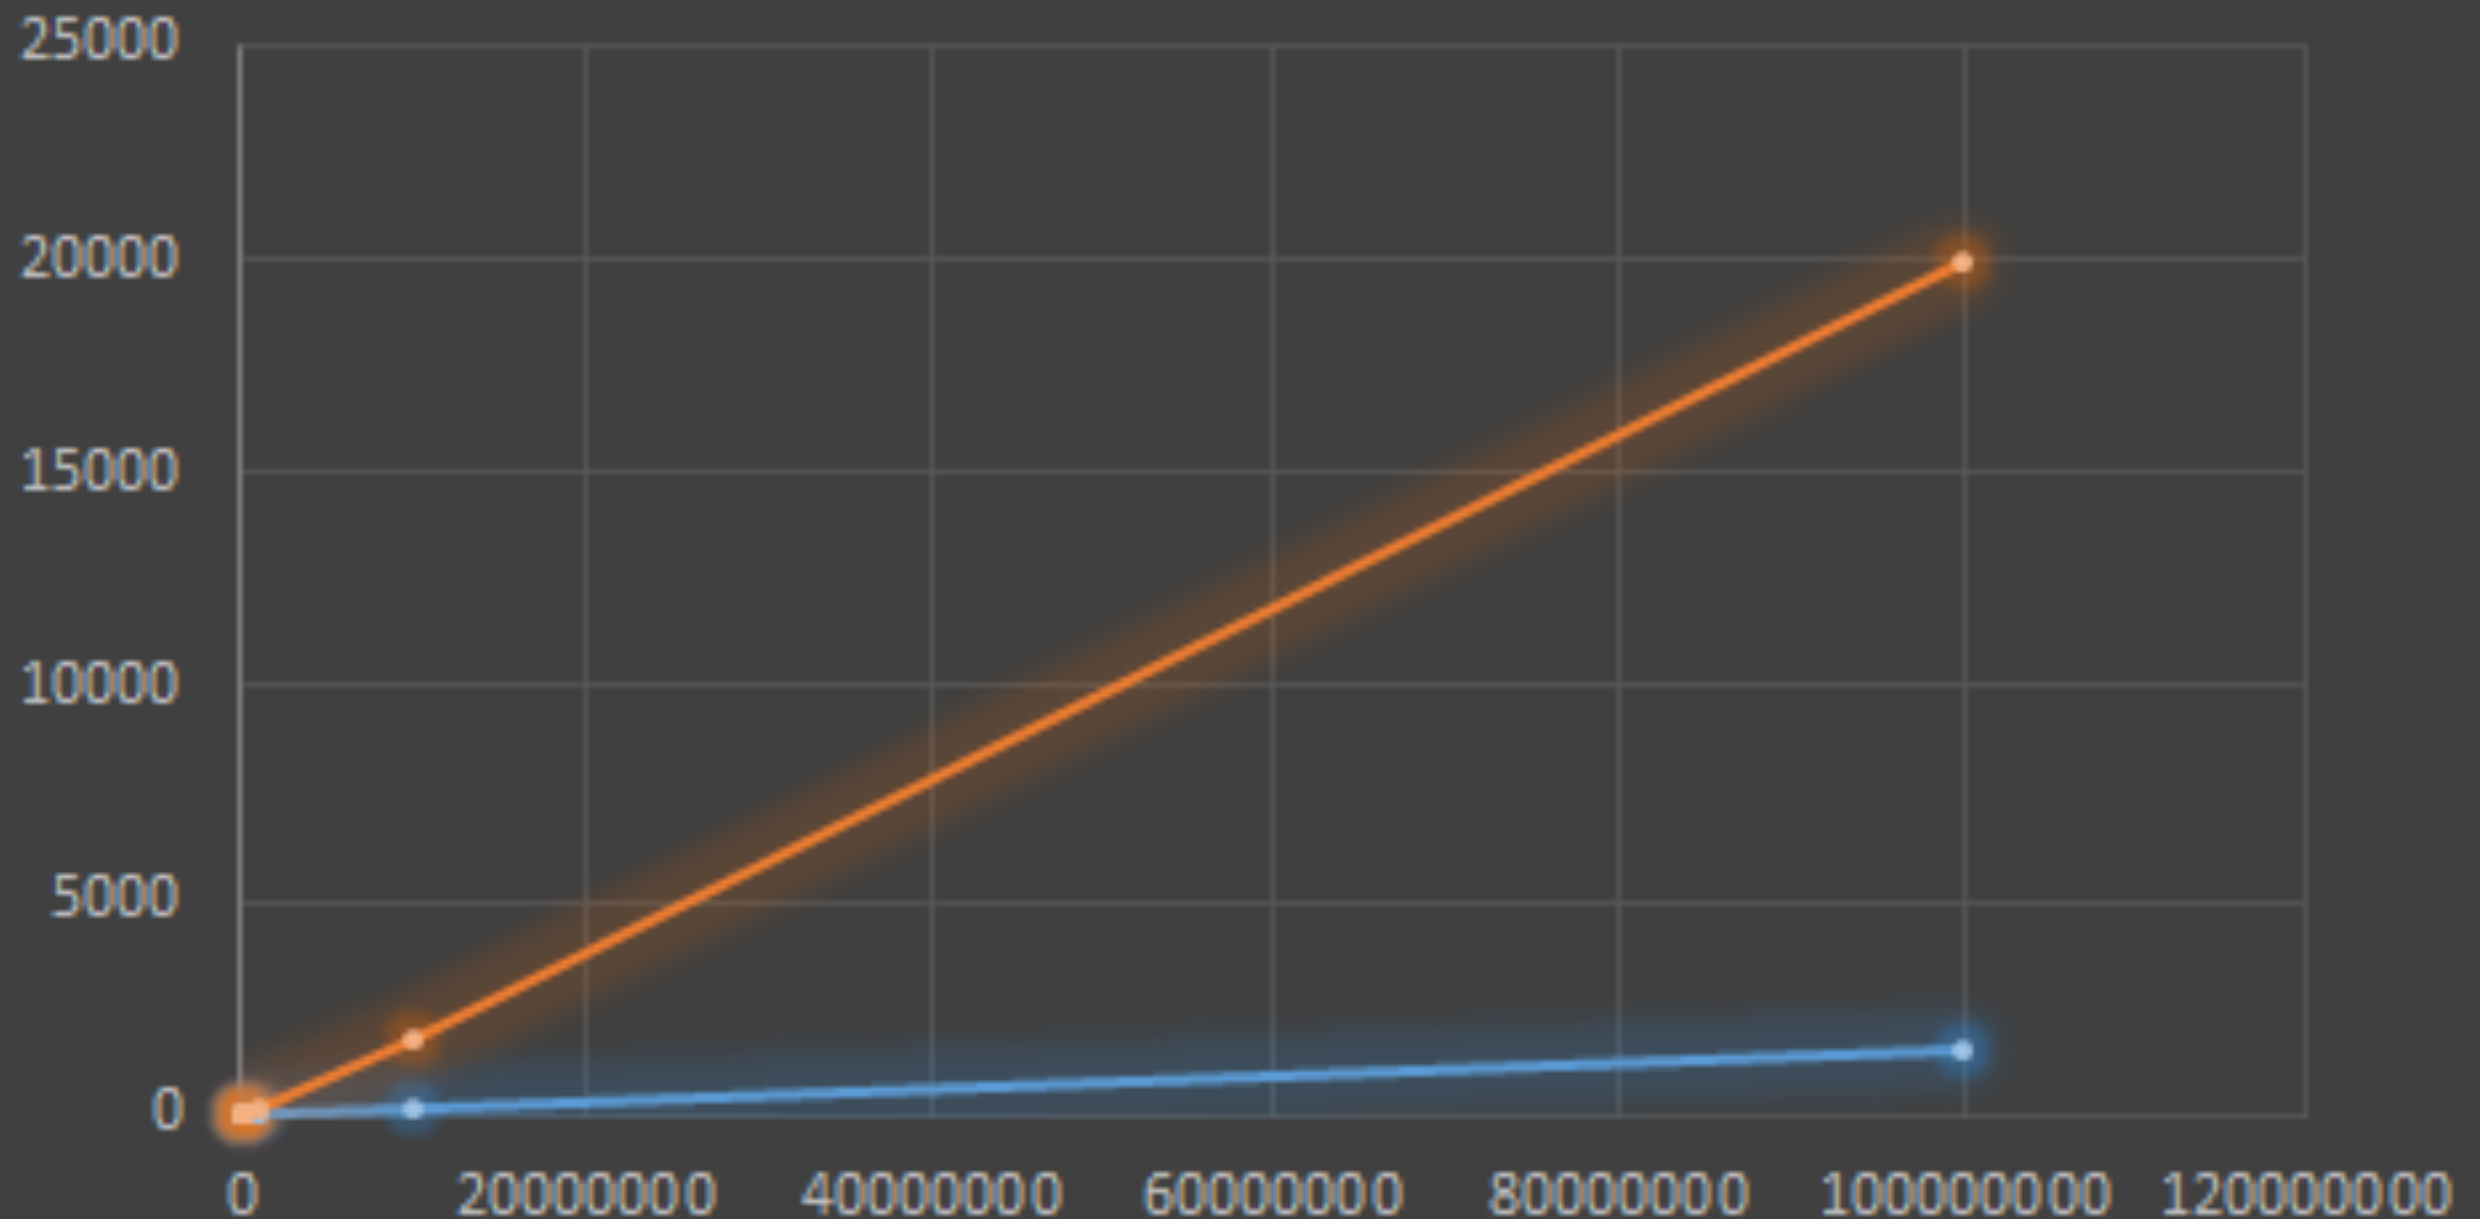

## STD::SORT – NOT-SORTED – RELEASE MODE – NO WARNINGS, MACBOOK PRO

$O(N\log(N))$  and `std::sort`

## STD::SORT – SORTED – RELEASE MODE – NO WARNINGS, MACBOOK PRO

$O(N \log(N))$  and `std::sort`

**THANK YOU!**
